

GF.3.1 Parameter and dependency ledger

Current accounting is explicit: 5 core postulates plus 3 anchors, with extra sectors quarantined and closure targets named.

Current core disposition

Gauge + lepton + native-RGE endpoint + precision-comparison accounting = 5 postulates + 3 anchors

Not a zero-parameter claim

Core P1-P5

Declared postulates / integer handles

- P1

Icosahedral cut-and-project ansatz
- P2

$n = -107$ electron gap-label exponent
- P3

$D_{H3} = 18$ invariant; stiffness-map assumption tracked separately
- P4

$N = 11$ muon harmonic exponent
- P5

$N = 17$ tau harmonic exponent

Anchors A1-A3

Imported or calibrated empirical anchors

- A1

m_e dimensional SI conversion anchor
- A2

$\alpha_2^{-1}(M_{GUT})$ endpoint boundary, approx 24-25
- A3

$\alpha(0)_{CODATA}$ used only in disclosed precision rows

Integer Handles

Precision-sector discrete choices

- 1440

Higgs VEV saturation handle
- 12

neutrino mass-sum geometric weight
- 360

fine-structure α multiplier
- 2

bilayer factor in $1/(2N)$ α correction

Extra sectors

Hadronic

H1-H4: charm, CKM, PMNS, proton sheet/exponent handles

Biophysical

B1-B4: CISS coupling, Zeno branch, bound water, bias

Cosmological

C1-C5: λ_{bio} , lag/evolution times, H_0/Ω , ρ_{bio} failure

Dependency flow

Bare structure

P1 plus phi geometry

Integer selection

P2-P5 and precision handles

Empirical anchoring

A1 scale, A2 endpoint, A3 α

Displayed quantitative rows

gauge, lepton, RGE, precision

Closure horizon

Target after closures: a 1-parameter core system, P1 plus A1, recovering dimensionless Standard Model structure from geometry alone.
Required closures: O.5, O.12, O.14, O.15, A2 endpoint derivation, A3 bare-to-physical α bridge.
