

The Microtubule Quantum Well and Zeno Gating

Microtubule Cross-Section Quantum Well

Detection Apparatus

time-binned against MEA/gamma-burst window

Falsifiability

anaesthetic-modulation differential; registered $> 3\sigma$ gate requires $N \gtrsim 10^5$ cycles; direct detection conditional on cryogenic TES + high-Q upgrade
signal $\sim 30 \times$ below cavity-integrated thermal floor after Dicke integration in the sapphire-cavity/TES geometry
