GF.3.1 Parameter and dependency ledger

Current sector accounting: 5 core postulates plus 6 continuous anchors; a named 6-coefficient-handle precision/gauge subset and O.38 N=144 are separate.

Current core disposition

Gauge + lepton + native-RGE endpoint + precision-comparison accounting = 5 postulates + 6 continuous anchors

Not a zero-parameter claim

Core P1-P5

Declared postulates / discrete-coefficient handles

P1	Icosahedral cut-and-project ansatz
P2	n = -107 electron gap-label exponent
P3	D_H3 = 18 invariant; stiffness-map assumption tracked separately
P4	N = 11 muon harmonic exponent
P5	N = 17 tau harmonic exponent

Continuous anchors A1-A6

Imported or calibrated empirical anchors

A1	m_e dimensional SI anchor
A2	alpha_2^-1(M_GUT) endpoint, approx 24-25
A3	alpha(0)_CODATA precision rows
A4	Z1 = 41/360 approx 0.114 hypercharge beta norm.
A5	Z2 = 19/54 approx 0.352 weak-isospin beta norm.
A6	Z3 = 0.7 colour beta norm.

Coefficient Handles

Named precision/gauge subset (not global total)

1440	Higgs VEV saturation handle
12	neutrino mass-sum geometric weight
360	fine-structure alpha multiplier
2	bilayer factor in 1/(2N) alpha correction
10φ²	bare strong inverse handle
1/5	muon g-2 equal-weight coefficient

Extra sectors

Hadronic

H1-H4: charm, CKM, PMNS, proton sheet/exponent handles

Biophysical

B1-B4: CISS coupling, Zeno branch, bound water, bias

Cosmological

C1-C5: lambda_bio, lag/evolution times, H0/Omega, rho_bio failure

Dependency flow

Bare structure
P1 plus phi geometry

→

Discrete-coefficient selection
P2-P5 and coefficient handles

→

Empirical anchoring
A1-A3 scale/endpoint/alpha; A4-A6 Z_i

→

Displayed quantitative rows
gauge, lepton, RGE, precision

Closure horizon

Target after closures: a 1-parameter core system, P1 plus A1, recovering dimensionless Standard Model structure from geometry alone.

Required closures: O.5, O.12, O.14, O.15; derive A2 and A4-A6; close the A3 bare-to-physical alpha bridge.

Source: Front Matter, Parameter Ledger, especially sections 0.1, 0.5, and 0.6
