Muon g-2 under WP2025: current gap is small; GCT offset overshoots

WP2025 residual scale

Survival branch

WP2025 high-HVP synthesis
SM-experiment gap ~0.6 sigma

not support

Add GCT vertex: $\frac{1}{5}(\alpha/\pi)^3$
$= 250.65 \times 10^{-11}$

Current disposition:
TENSION under WP2025

Survives only if R-ratio/lattice arbitration reopens a >3σ gap near the GCT offset.
